Free closing window handle

Product profile

As a free closing window handle this model offers effective protection against opening windows and balcony doors unauthorizedly. It also serves as a childproof lock.

Function: conventionally lockable window handles prevent a turning of the handle or the button over shutdown in the handle.

Free closing window handles are freely rotatable with a 90 degree catch without effect on the square spindle or the window mechanic. At this principle no pressure point for a violent opening from inside or from outside can be reached. The handle can be closed in every click-in position and the choosen attitude of the tilt and turn over mechanics is therefore protected from unauthorized access. So the free activation can be carried out also in tilt over position.

Standard version
